Webhook Documentation – Priiize Digital Scratch-Offs

How to Add a Webhook to your digital scratch card campaigns.

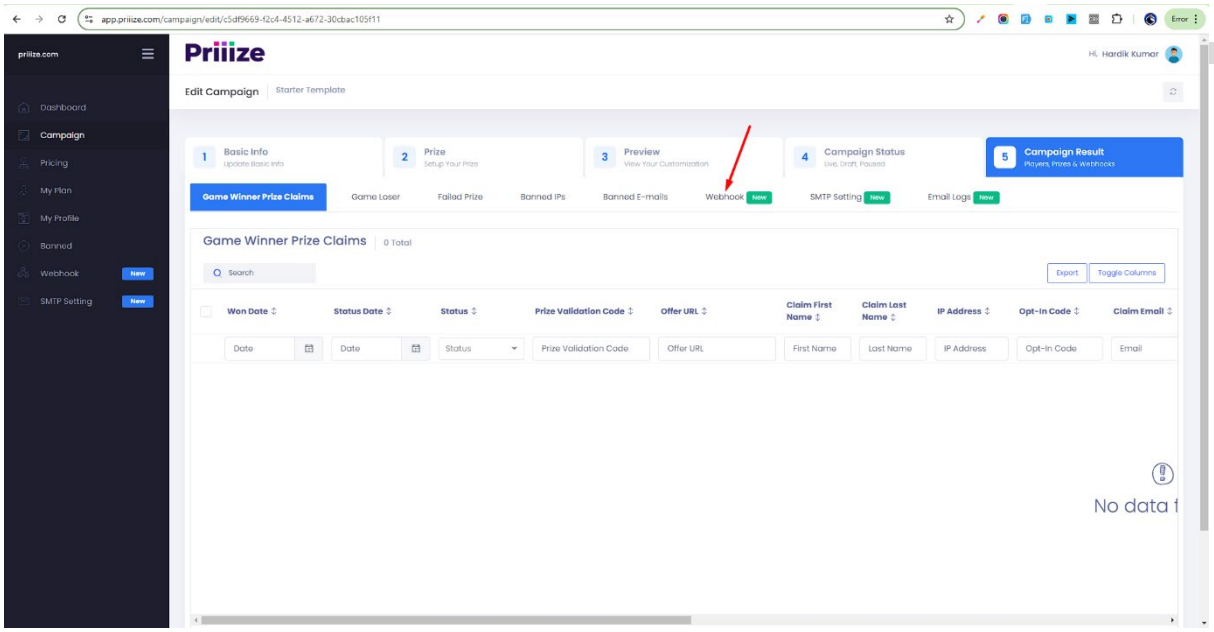

1. **Select a Campaign**:
    - Navigate to the campaign list and select the desired campaign.

2. **Go to Campaign Results**:
    - Click on the **Campaign Results** tab.

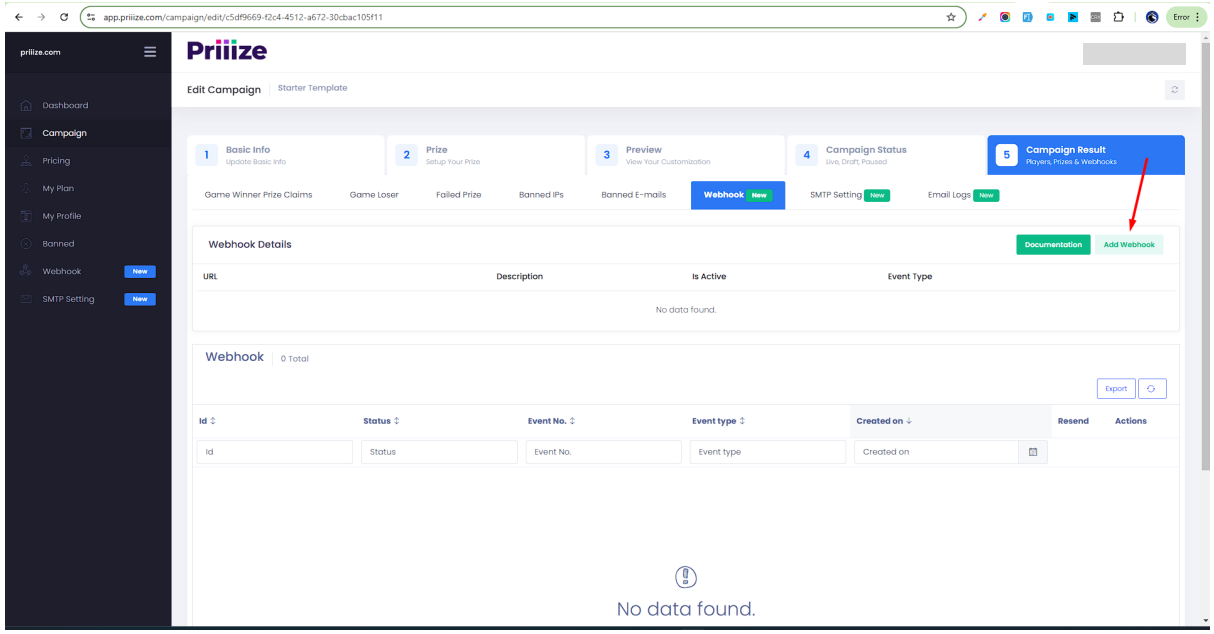

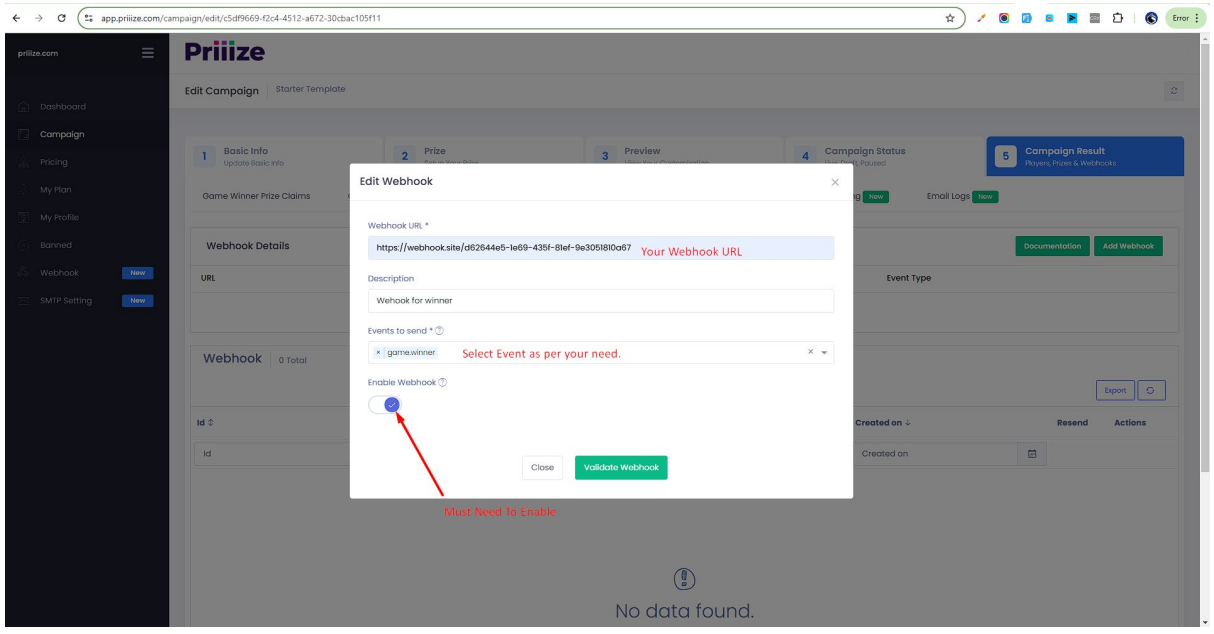

3. **Access Webhook Settings**:
    - In the **Webhook** tab, you will find two options:

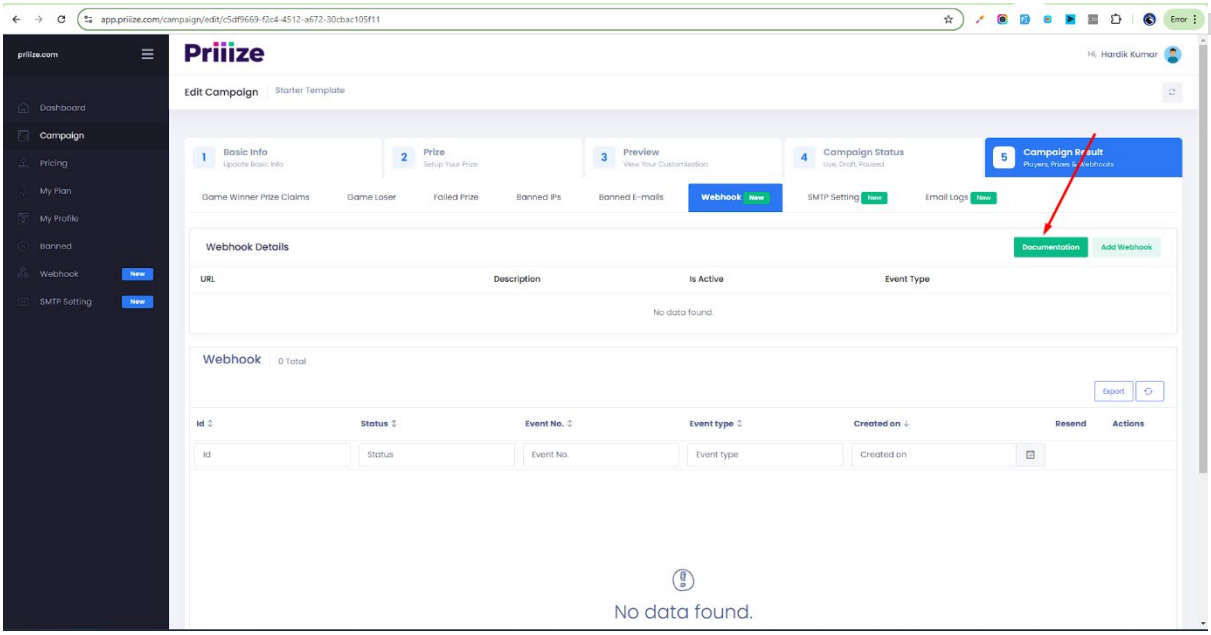

- **Add**

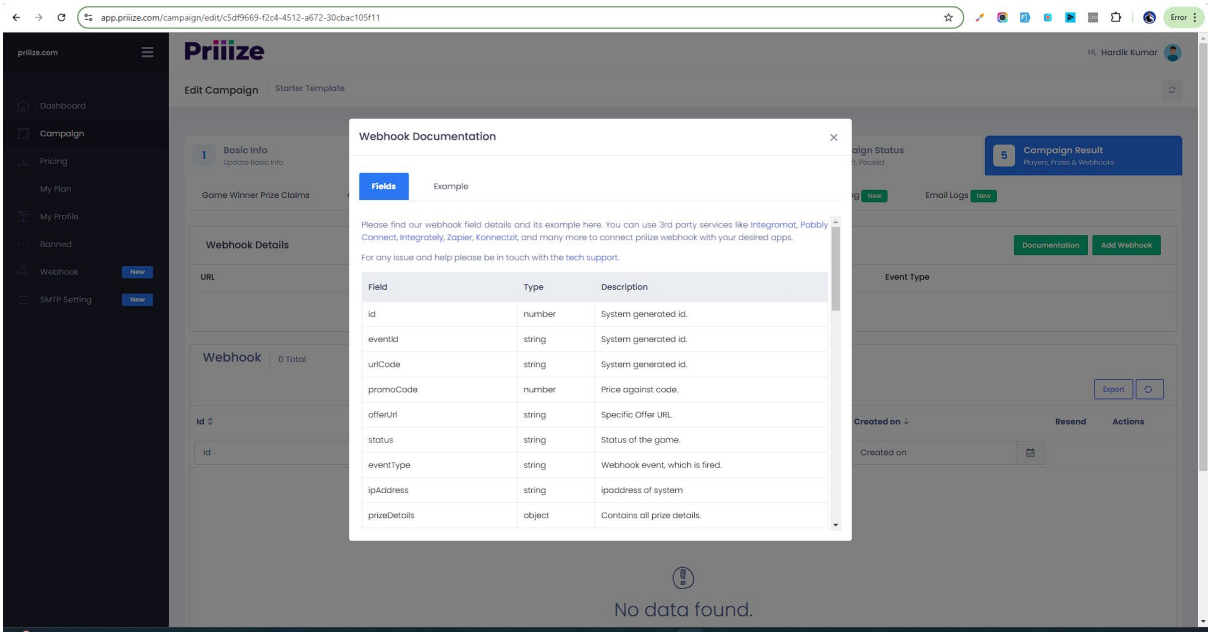

Webhook: Configure a new webhook.

- **Webhook Documentation**: View details on webhook integration.

4. **Configure Webhook**:
    - Click **Add Webhook** and enter the required details:
        - Webhook URL
        - Description
        - Events to send (Select from available events)
        - Enable the webhook
    - Once configured, save and validate the webhook.

Webhook Events and Data Structure

- When an event is triggered, data is sent to the configured webhook URL.
- The payload structure varies based on the selected event and is documented in the **Webhook Documentation** tab.
- Ensure you integrate based on the example responses provided in the documentation.

game.winner Event

The **game.winner** event is triggered when a participant wins a game in the campaign. Once this event fires, the system sends a webhook request to the configured URL with the following payload:

How It Works:

1. The user plays the game in the campaign.
2. If they win, the **game.winner** event fires automatically.
3. The webhook sends the event data, including prize details and user information, to the specified URL.
4. The receiving system can process the event to issue the prize, update records, or trigger further actions.

Integration Guidelines

- Use third-party services like **Zapier, Integromat, Pabbly Connect, Integrately, Konnectzit**, etc., for easy integration.
- Validate webhook requests and log incoming data for troubleshooting.
- Implement error handling and retry mechanisms for failed requests.
